A Comment on Gauge-Fixing

General Remarks on gauge-fixing:

- ▶ Gauge-fixing picks certain features of theory – chooses subset of the space \mathcal{A} of all gauge configurations.
- ▶ Same physical effect may look very different in different gauges. Description of an effect may be especially easy in a certain gauge.
- ▶ Gauge-dependent quantities may look quite “unphysical” (scalar fermions, instantaneous potentials, ...)

Basic Facts about Coulomb gauge (I)

Particular choice: Coulomb gauge

$$\partial_i A_i = 0$$

Gauge-fixing done on each time-slice separately. Gauge fixed theory left invariant under time-dependent gauge-transformations $g(t)$.

For correlator $\langle O_1(t_1) O_2(t_2) \rangle$ with $t_1 \neq t_2$: Gauge-fixing can be undone for all intermediate times

All gauge-variant quantities washed away by averaging over all configurations, only gauge-invariant (“physical”) quantities propagate $\xrightarrow{\text{usual arg.}}$ positive state space.

Basic Facts about Coulomb gauge (II)

- ▶ Positive definite state space allows **variational calculations**

- ▶ Gauß' law

$$(\delta^{ab}\partial_i + gf^{acb}A_i^c)E_j^b = -g\rho_q^a$$

directly implemented, related to vanishing of total color charge, [Reinhardt, Watson; 2008]

- ▶ Gauge-fixing at different time-slices independent
→ allows independent rotations in color space

$$\langle A^a(\mathbf{x}, t_1)B^b(\mathbf{y}, t_2) \rangle = R^{aa'}(t_1)R^{bb'}(t_2)\langle A^{a'}(\mathbf{x}, t_1)B^{b'}(\mathbf{y}, t_2) \rangle$$

correlators of (fundamentally) color-charged fields vanish for unequal times, [Baulieu, Zwanziger; 1999]

Basic Facts about Coulomb gauge (II)

- ▶ Positive definite state space allows **variational calculations**
- ▶ Gauß' law

$$(\delta^{ab}\partial_i + gf^{acb}A_i^c)E_i^b = -g\rho_q^a$$

correlators of (fundamentally) color-charged fields vanish for unequal times, [Baulieu, Zwanziger; 1999]

Basic Facts about Coulomb gauge (III)

- ▶ Even perturbative renormalizability not (yet) proven

- ▶ Non-covariance makes calculations cumbersome.

- ▶ Statement about Confinement –

Zwanziger inequality, [Zwanziger; 2003]:

Write A_0 - A_0 propagator as

$$D_{00}(x) = V_C(x) \delta(t) + (\text{non.-inst.})$$

One can show that for large $|x|$

$$V_{\text{Wilson}}(x) \leq -\frac{4}{3} V_C(x)$$

No Confinement without Coulomb Confinement

- ▶ V_{Wilson} lin. rising $\rightarrow V_C(x)$ (at least) lin. rising
- ▶ *lhs*: path-ordered exponential, i.e. infinite series of arbitrarily high n -point functions;
- rhs*: piece of one 2-point function

Basic Facts about Coulomb gauge (III)

- ▶ Even perturbative renormalizability not (yet) proven
- ▶ Non-covariance makes calculations cumbersome.

▶ Statement about Confinement –

Summary and Discussion

The Gribov-Zwanziger Scenario (I)

- ▶ Gauge-fixing not unique in non-Abelian gauge theory – **Gribov problem**
- ▶ Initial proposal, [Gribov; 1977]: Restrict functional integral to **Gribov region** Ω , $\mathcal{M}_{FP} = -\partial \cdot D > 0$
- ▶ Later refinement, [Semenov-Tyan-Shanskii, Franke; 1982], [Zwanziger; 1982]: Gribov copies even inside Ω , restrict functional integral to **Fundamental Modular Region** Λ (nontrivial topology, [van Baal; 1992])

The Gribov-Zwanziger Scenario (II)

- ▶ Ω is infinite-dimensional convex region
→ boundary dominates
- ▶ $\lambda_{\min}(\mathcal{M}_{FP}) \rightarrow 0$, enhanced ghost and suppressed (transverse) gluon propagation for small momenta – Gribov-Zwanziger confinement scenario, [Gribov; 1977], [Zwanziger; 1989]
- ▶ Perturbation theory lives around $A = 0$, knows nothing about the Gribov horizon.
- ▶ Fadeev-Popov method has to be modified to account for nonperturbative effects, [Zwanziger; 1981, 2003]
- ▶ Scenario first derived in Coulomb gauge, but not limited to it.

The Gribov-Zwanziger Scenario (II)

- ▶ Ω is infinite-dimensional convex region
→ boundary dominates
- ▶ $\lambda_{\min}(\mathcal{M}_{\text{FP}}) \rightarrow 0$, enhanced ghost and suppressed (transverse) gluon propagation for small momenta – **Gribov-Zwanziger confinement scenario**, [Gribov; 1977], [Zwanziger; 1989]
- ▶ Perturbation theory lives around $A = 0$, knows nothing about the Gribov horizon.
- ▶ Fadeev-Popov method has to be modified to account for nonperturbative effects, [Zwanziger; 1981, 2003]
- ▶ Scenario first derived in Coulomb gauge, but not limited to it.

The Gribov-Zwanziger Scenario (II)

- ▶ Ω is infinite-dimensional convex region
→ boundary dominates
- ▶ $\lambda_{\min}(\mathcal{M}_{\text{FP}}) \rightarrow 0$, enhanced ghost and suppressed (transverse) gluon propagation for small momenta – **Gribov-Zwanziger confinement scenario**, [Gribov; 1977], [Zwanziger; 1989]
- ▶ Perturbation theory lives around $A = 0$, knows nothing about the Gribov horizon.
 - ▶ Fadeev-Popov method has to be modified to account for nonperturbative effects, [Zwanziger; 1981, 2003]

The Quark Propagator (II)

Quark propagator contains instances of p_0 both **explicitly** and as **argument** of the dressing functions A , B , C , D .

$$iS^{-1}(p) = \gamma^0 p_0 A(\mathbf{p}^2, p_0^2) - B(\mathbf{p}^2, p_0^2) - \gamma^i p_i C(\mathbf{p}^2, p_0^2) + \gamma^0 p_0 \gamma^i p_i D(\mathbf{p}^2, p_0^2) + i\varepsilon.$$

The Quark Propagator (II)

Quark propagator contains instances of p_0 both **explicitly** and as **argument** of the dressing functions A , B , C , D .

$$iS^{-1}(p) = \gamma^0 p_0 A(\mathbf{p}^2, p_0^2) - B(\mathbf{p}^2, p_0^2) - \gamma^i p_i C(\mathbf{p}^2, p_0^2) + \gamma^0 p_0 \gamma^i p_i D(\mathbf{p}^2, p_0^2) + i\epsilon.$$

We find $A \sim 1$, $D \ll 1$, $B \sim \frac{1}{\mu_{IR}}$ and $C \sim \frac{1}{\mu_{IR}}$. Explicitly p_0 -dependent terms are subleading for $\mu_{IR} \rightarrow 0$.

The Quark Propagator (II)

Quark propagator contains instances of p_0 both **explicitly** and as **argument** of the dressing functions A , B , C , D .

$$iS^{-1}(p) = \gamma^0 p_0 A(p^2, p_0^2) - B(p^2, p_0^2) - \gamma^i p_i C(p^2, p_0^2) + \gamma^0 p_0 \gamma^i p_i D(p^2, p_0^2) + i\varepsilon.$$

We find $A \sim 1$, $D \ll 1$, $B \sim \frac{1}{\mu_{IR}}$ and $C \sim \frac{1}{\mu_{IR}}$. Explicitly p_0 -dependent terms are subleading for $\mu_{IR} \rightarrow 0$.

A and D vary with p_0 , but suppressed

Summary and Discussion

Summary and Discussion

- ▶ Quark propagator extracted from gap equation, **confining potential** provided by D_{00} , introduction of infrared regulator μ_{IR}
- ▶ $\mu_{IR} \rightarrow 0$: Colored fields get localized on single time-slices and do not propagate in time. Gauge-variant quantities vanish or diverge.
- ▶ Direct connection between reduction to physical state space and infrared singularities.
- ▶ **Agreement** with expectations for incomplete gauge-fixing.
- ▶ Interpretation: Only for μ_{IR} -regularized theory quarks, (maybe gluons) are "good" degrees of freedom. For $\mu_{IR} \rightarrow 0$ only physical combinations of fields survive.

Summary and Discussion

- ▶ Quark propagator extracted from gap equation, **confining potential** provided by D_{00} , introduction of infrared regulator μ_{IR}

TASK: Determine properties of **high-T QCD**

▶ straightforward approach – **perturbation theory**

▶ hope: **high** temperature T

→ **large** momentum transfer $\mu \sim 2\pi T$

→ **small** coupling constant $g(\mu)$

→ **reliable** perturbative expansion

... but nature is not always that kind.

▶ Maxwell-like distribution – even for high T always small momenta present → *can't escape the infrared*

▶ $T \rightarrow \infty$ means $\beta \equiv \frac{1}{T} \rightarrow 0$, i.e. 3-dim. YM theory

confining theory → **nonperturbative effects important**

Summary and Discussion

Finite-Temperature QCD and Infrared Problems (II)

- ▶ Nonanalyticities yield terms $\mathcal{O}(g^3)$, $\mathcal{O}(g^4 \ln g)$, ...
- ▶ Certain diagrams give, [Linde, 1980]

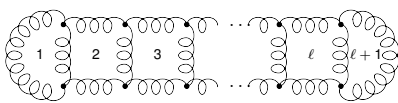

$$\sim \begin{cases} g^{2l} T^4 & \text{for } l = 1, 2 \\ g^6 T^4 \ln \frac{T}{m} & \text{for } l = 3 \\ g^6 T^4 \left(\frac{g^2 T}{m}\right)^{l-3} & \text{for } l > 3 \end{cases}$$

with some dynamically generated screening mass m

- ▶ best possible case:
 $m \sim g^2 T$ (chromomagnetic screening mass)
- ▶ infinitely many diagrams of order g^6 , no resummation possible \rightarrow infrared barrier

Finite-Temperature QCD and Infrared Problems (II)

- ▶ Nonanalyticities yield terms $\mathcal{O}(g^3)$, $\mathcal{O}(g^4 \ln g)$, ...
- ▶ Certain diagrams give, [Linde; 1980]

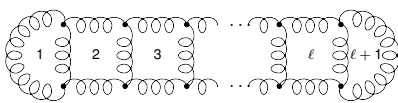

$$\sim \begin{cases} g^{2\ell} T^4 & \text{for } \ell = 1, 2 \\ g^6 T^4 \ln \frac{T}{m} & \text{for } \ell = 3 \\ g^6 T^4 \left(\frac{g^2 T}{m}\right)^{\ell-3} & \text{for } \ell > 3 \end{cases}$$

Numerical Results
Summary and Discussion

Finite-Temperature QCD and Infrared Problems (III)

- ▶ Calculations for accessible orders were a formidable task
- ▶ Convergence extremely poor for reasonable temperatures, [K. Kajantie, M. Laine, K. Rummukainen, Y. Schröder; 2001]
- ▶ Description with consecutive field theories, [E. Braaten, A. Nieto; 1995], living at different scales $2\pi T \gg gT \gg g^2 T$
- ▶ At lowest scale genuine nonperturbative theory (MQCD – magnetostatic QCD)
- ▶ MQCD contributions to free energy w set in at $\mathcal{O}(g^6)$ – Linde barrier . . . How to access this sector?

Pressure from the Gribov Horizon (I)

- ▶ Idea: **explicitly** include contributions from Gribov horizon in a (semi)perturbative approach also for finite T , [Zwanziger; 2006]
- ▶ access to **confined** sector even in “deconfined” phase
- ▶ Introduction of an additional **BRST-exact term**, which gives rise to a quartet of two auxiliary Bose and two Fermi ghosts
- ▶ Use auxiliary ghosts to introduce horizon function (concentrated at boundary of Ω)
- ▶ Stationarity of the quantum effective action Γ → new vacuum
- ▶ Perturbative expansion again possible, yields **Gribov-type** gluon dispersion relation

$$E(k^2) = \sqrt{k^2 + \frac{m^4}{k^2}}$$

Pressure from the Gribov Horizon (I)

Large deviations: numerical solution \leftrightarrow leading order

Summary and Discussion

- ▶ Access to nonperturbative sector by **cutoff at Gribov horizon** – almost purely **analytical** method

- ▶ Manifestation of **confinement** in “deconfined” phase

- ▶ Thermodynamic observables calculable (perturbative results have to be added)

- ▶ Results compatible with lattice calculations

- ▶ Full results **deviate significantly** from leading order expression...

... but recall, series expansions are usually **at best asymptotic** (and may, in this case, already be beyond the order of apparent convergence)

- ▶ Additional evidence that **series expansions** are extremely **problematic** in **hot QCD**.

Summary and Discussion
